# Some background

- School of Construction, Southern Alberta Institute of Technology
  - SAIT's focus is on applied education - development of the hand and the mind through innovation, leading programs and best-practice pedagogy
  - SAIT's vision is to be global leader in Applied Education
  - Student Success
    - Leveraging online opportunities

# Cisco e-learning research

- Adult learners - Applied education and technical courses
  - Research focus - What is perception of the students and instructors about online learning?

# Online learning and effectiveness

- My research
  - Cisco e-learning chair
  - Applied education and online learning
- Personal experience
  - As a faculty
  - As a student

# Background review

# Online education

- Please select one of the options about your experience in online education.
  - I have taught one or more online courses
  - I have taken one full credit online course
  - Both
  - None

# Graduation rate of online students

- Virtual School - High school graduation rate
  - 87% are low-grad-rate schools
  - Average graduation rate 40 %

School type	Below 67%	Above 85%	Average
Regular	7	64	85
Charter	30	44	70
Alternative	57	8	52
Virtual	87	4	40

# Online learning

- “Analyses yield robust negative estimates for online learning in terms of both course persistence and course grade, contradicting the notion that there is no significant difference between online and face-to-face student outcomes—at least within the community college setting. Accordingly, both two-year and four-year colleges may wish to focus on evaluating and improving the quality of online coursework before engaging in further expansions of online learning (Xu & Jaggars, 2013).”

# Online learning – Quality concerns

- [We do not claim that our results are definitive].....  
“our findings indicate that much more experimentation is necessary before one can credibly declare that online education is peer to traditional live classroom instruction, let alone superior to live instruction (Figilo, Rush & Yin, 2010).”

# Online learning – Quality concerns

- The proportion of academic leaders that rated online education as good as or better than face-to-face instruction was 57.2% in 2003. The relative view of online quality has improved over time, with a pattern of slow but steady improvement in the relative view of online learning outcomes from 2003 until 2012, where 77.0% of the respondents rated online as good or better. Results since then, however, have shown been less positive, with the results for 2015 showing only 71.4% rating online as good or better.

# Online education

- Compared to face-to-face learning, quality of online learning is
  - Higher
  - Similar
  - Lower
  - Can't say

# Online courses

- Quality online courses are well-organized into learning units; have clear learning goals and objectives; include materials and activities that directly support the learning goals and objectives; engage the learner through interaction with content, other students and the instructor; and offer rich and relevant resources for students. Most of all, online courses should be fun, engaging, pedagogically sound, and relevant.

# Online courses

- Quality online courses are well-organized into learning units; have clear learning goals and objectives; include materials and activities that directly support the learning goals and objectives; engage the learner through interaction with content, other students and the instructor; and offer rich and relevant resources for students. Most of all, online courses should be fun, engaging, pedagogically sound, and relevant.

# Increasing effectiveness – Online learning

Content

- Delivery – Instructor – learner interaction

Delivery

# Learning Objectives

# One destination, one trail

A clear objective leads to  
the most efficient path of  
learning

Setting the goal right !

# Learning Objectives

- Curriculum design is one of the factors affecting academic performance (Tyler, 1971)
- Course objectives increased students' academic performance (Stecker, Fuchs & Fuchs, 2005)
- In distance teaching and education, we should shift the main focus from inputs to outcomes (Gaskell & Mills, 2014)

# Bloom's taxonomy

- How familiar are you with Bloom's taxonomy?
  - Yes, I've used it in course development
  - Yes, I've heard about it
  - No, this is something new to me

# Defining Learning Objectives

- Bloom's taxonomy
- Outcomes in the domain of knowledge, skill and attitude
- Organized into categories – simple to complex and concrete to abstracts
- Focus is on verbs – Memorize, Recite, Solve

# Objectives - Beyond the verbs

---

- An example
- By the end of this course, students should be able to:
  - Solve problems involving motion in one dimension

About 247,000 results (0.44 seconds)

Description of Motion in One Dimension. Motion is described in terms of displacement (x), time (t), velocity (v), and **acceleration** (a). Velocity is the rate of change of displacement and the **acceleration** is the rate of change of velocity.

## 1.2 Examples of Motion in One Dimension

To gain some experience with solving equations of motion in a physical world, we will consider some physically relevant examples of one-dimensional motion.

### 1.2.1 Uniform force

With  $F = -mg$ , appropriate for a particle falling under the influence of a uniform gravitational field, we have  $m \ddot{x} = -mg$ .

With  $v = \dot{x}$ , we solve  $\dot{v} = -g$ .

$$\int_{v(0)}^{v(t)} dv = \int_0^t ds (-g), \quad \text{etc}$$
$$\int_{v(0)}^{v(t)} dv = \int_0^t ds (-g)$$

## Description of Motion in One Dimension

Motion is described in terms of **displacement** ( $x$ ), time ( $t$ ), **velocity** ( $v$ ), and **acceleration** ( $a$ ). Velocity is the rate of change of displacement and the acceleration is the rate of change of velocity. The average velocity and average acceleration are defined by the relationships:

$$\text{Average velocity: } \bar{v} = \frac{\Delta x}{\Delta t} \quad \text{Average acceleration: } \bar{a} = \frac{\Delta v}{\Delta t}$$

where the Greek letter  $\Delta$  indicates the change in the quantity following it.

Constant acceleration equations.

1.  $x = \bar{v} t$  More Detail  $\bar{v} = \frac{v_0 + v}{2}$
2.  $v = v_0 + at$
3.  $x = v_0 t + \frac{1}{2} at^2$  Show

A bar above any quantity indicates that it is the average value of that quantity. If the acceleration is constant, then equations 1, 2 and 3 represent a complete description of the motion. Equation 4 is obtained by a combination of the others. Click on any of the equations for an example.

# Objectives - Beyond the verbs
